Appendix 4:
Data Tables (Race & Ethnicity)

Prepared for:

University of New Mexico

USING THE DATA TABLES

This Appendix contains data tabulations for all NCCS questions. These tables show mean or percentage frequency response (%) comparisons for the following key groups of students:

- Total Sample
- Hispanic vs. Non-Hispanic
- Represented vs. Under-Represented (race)
  - Under-Represented race group includes: African American/Black, Hispanic, American Indian, Alaskan Native, Multi-Racial
Statistical testing between groups was performed using $\alpha = 0.05$ (95% confidence interval). Means are provided where applicable. If sample or post-stratification weights were generated for your data, those weights were used in the development of this report. Please refer to the Main Report section called *Post-Survey Adjustment and Weighting Technical Details* of the Main Report for more details regarding the weights.

Cells in tables that contain less than 15 cases are designated with "<15." This means that fewer than 15 respondents answered a particular question. In order to ensure respondent confidentiality and anonymity – and to avoid possible data misinterpretation that could lead to erroneous conclusions – the NCCS requires at least 15 cases to report actual number of responses and to make an item eligible for statistical testing. Cells in tables that contain zero (0) responses are designated with a "*".

Data tabulation tables use standard default values for all variables; please refer to the section of the main report called *Report and Specific School Terminology* for school provided terms and designations. This can be found at the end of the Main Report.

Figures 1 and 2, on the following page, show sample tables and highlight what data is reported in the tabulations, along with an example of how to interpret the significance testing. The figures are presented for instructional purposes only – the data they contain is example data (not data from your school), and the questions (rows) and categories (columns) may differ from the actual reported tables that follow.

Results are based on two-sided tests assuming equal variances with significance level .05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Statistical Comparison Results for Class Status:
The mean age of Graduate Students is significantly higher than the mean age of Undergraduates. The letter presented in the cell corresponds to the label of the column to which this value is significantly different.

Results are based on two-sided tests with significance level .05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Statistical Comparison Results for Class Status:
Undergraduate students are significantly more likely to have been born in the United States compared to Graduate Students. The letter presented in the cell corresponds to the label of the column to which this value is significantly different.

Results are based on two-sided tests with significance level .05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.[b]

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
